Lab12-Q1

You are given two integer arrays `nums1` and `nums2`, sorted in non-decreasing order, and two integers `m` and `n`, representing the number of elements in `nums1` and `nums2` respectively.

Merge `nums1` and `nums2` into a single array sorted in non-decreasing order.

The final sorted array should not be returned by the function, but instead be *stored inside the array* `nums1`. To accommodate this, `nums1` has a length of `m + n`, where the first `m` elements denote the elements that should be merged, and the last `n` elements are set to 0 and should be ignored. `nums2` has a length of `n`.

```
#include<iostream>
```

```
class Solution {
public:
    void merge(vector<int>& nums1, int m, vector<int>& nums2, int n) {
        int p1 = m - 1;           // nums1 指標（有效元素）
        int p2 = n - 1;           // nums2 指標
        int p = m + n - 1;        // nums1 最末端指標

        while (p1 >= 0 && p2 >= 0) {
            if (nums1[p1] > nums2[p2]) {
                nums1[p--] = nums1[p1--];
            } else {
                nums1[p--] = nums2[p2--];
            }
        }

        // 如果 nums2 還有剩，補上去（nums1 剩下的不用補，已在原位）
        while (p2 >= 0) {
            nums1[p--] = nums2[p2--];
        }
    }
};
```

Code | C++

```
class Solution {
public:
    void merge(vector<int>& nums1, int m, vector<int>& nums2, int n) {
        int p1 = m - 1; // nums1 指標 (有效元素)
        int p2 = n - 1; // nums2 指標
        int p = m + n - 1; // nums1 最末端指標

        while (p1 >= 0 && p2 >= 0) {
            if (nums1[p1] > nums2[p2]) {
                nums1[p--] = nums1[p1--];
            } else {
                nums1[p--] = nums2[p2--];
            }
        }

        // 如果 nums2 還有剩，補上去 (nums1 剩下的不用補，已在原位)
        while (p2 >= 0) {
            nums1[p--] = nums2[p2--];
        }
    }
};
```

複雜度： $O(m + n)$

邏輯：
